

# ADM Flexible Bag Collator

ADM Packaging Technology, an Australian company, is behind the design, and development of the new Flexible bag collator for the Packaging industry. The Rotopack bag collator is a new innovative design never built before. We were so excited by this new development we applied for a patent.

The Rotopack is used on end of line packaging. It is located at the end of bag makers, flow wrappers or any line that requires product collating. As the bags come off a conveyor and drop down a chute, they land upright in a divider rack in an orderly fashion. The separated products travel around the table presenting themselves ready for easy collecting and place in cartons making the process more efficient, cost effective and profitable.

The procedure is simple, as each bag lands the table indexes forward to accept the next bag and this is done in a continuous and or intermittent motion. The rotopack adapts to speed change as the packs land into the divider rack and the collated bags make their way around to the packer. The packer gently with two hands pickup 2 bags or more each time and place the bags into the case. The process of packing can be cut in half making the collator efficient, fast and effective to your packing line. Where speed and efficiency is a daily topic in the packaging industry, the Rotopack can now offer all the advantages to achieve a better than ever before higher outputs.

The Rotopack can regularly collate up to 120 bags per minute for any product size and weight that can fit into the different size divider racks made available. The divider rack has a unique design to that allows the bags to be totally separated and the curved angles allow extra hand placements for operator to collect the bags. The divider rack can be changed over within five minutes and are available in small, medium and large.
