

# ADM Product Feed Elevator

ADM Packaging Technology manufacture and supply a range of product feed conveyors to transfer free flowing food products to different heights. The MCV5 Modular incline conveyor offers all the advantages needed to convey raw products to a required height. In this range of conveyors we offer standard and custom made conveyors to suit most applications.

The feature of this conveyor is the robust and very flexible thermo drive belt. The flat belt is manufactured with protruding tracks moulded on the underside to offer positive drive. The conveyor is driven using the same sprockets needed to drive plastic modular belts. This style of belt is used for the conveying of mainly food products that cannot be transported by plastic modular belts. The thermo drive offers the extra advantage that prevents food from being entrapped between the modular linkages that can grow into bacteria. Different types of products conveyed include free flowing, cereals, nuts, meats, salads, vegetables, pasta shredded cheese and non foods.

The conveyor is manufactured in all stainless steel and other food grade components to offer all the advantages for the wet and hygienic applications. The conveyor can be designed offering different heights, angles and entry/exit horizontal lengths. For best control ADM use a variable speed inverter that includes a soft start control, ON OFF isolator and parameter entry fields built into an IP65 control box.
